

Geotools GUI Installation

Download proj.zip and unzip the file wherever you want.

Create a new environment variable called PROJ_LIB which points to that unzipped folder (open up the folder to make sure everything is there, sometimes winzip can create a /proj/proj/ rather than just a /proj). I've put an example below:

Create another environment variable called USE_PATH_FOR_GDAL_PYTHON and set the value to YES.

Once the variables are set, you can run the .exe either by double clicking on it, or via cmd (cmd allows you to better monitor the text output generated by print statements in the original code).
